Where should your AI agent instructions live for just you?

One reusable set of rules. A private home on each platform.

For your own use, save the instructions in a project or agent that only you open, then start your chats inside it.

PLATFORM	WHERE THE INSTRUCTIONS LIVE	HOW YOU USE IT
ChatGPT	**Projects > your project > ... > Project settings.** Add the instructions and upload reference files. They apply only to that project and override your global custom instructions.	Start a chat from the project page. While the project stays private, only you can see its chats, files and instructions. Official guide
Claude	**Projects > your project > Set project instructions, then Save.** Add supporting documents to project knowledge with the + button.	Start your chats from inside the project. On Team or Enterprise, choose Keep it private when you set it up. Official guide
Microsoft 365 Copilot	**Agent Builder > your agent > Configure > Instructions.** Up to 8,000 characters. The Describe tab can draft them for you.	Use the Try it tab to chat with your agent. Sharing is a separate step, so leave it out. Official guide
Google Gemini	**Gems > your Gem > Instructions.** Add files for reference, then click Save. Previewing does not save the Gem.	Open the Gem from Gems in the sidebar and chat. Only people you give access to can open it. Official guide
Grok	**Projects > your project > Instructions > Edit.** Optionally choose a default model and upload source files.	Start chats from the project in the main workspace. Every chat follows the same instructions. Walkthrough
Meta AI	**No Project or instructions route.** Meta AI has no place to store a prompt. Memory holds personal details only.	New AI Studio character creation and editing stopped in August 2026. Meta help

Keep a master copy. Store the approved instructions in a document you own, with a version date. Copy them into each platform; changes to the document do not automatically update the assistants. When colleagues need the same assistant, use the sharing guide instead.
